

Our multi-color tiles in Color Through are intentionally manufactured with varying amounts of flashing in differing locations on the tile. This breaks up the potential for monotony and helps to minimize the possibility of vertical or diagonal lines down the roof. In a multi-color tile, for example, you may have one sample that has a more prominent base color, a second sample with a more prominent flash, and a third sample with the other flash more prominent. When selling a multi-color tile it is important that the customer sees samples that exhibit these characteristics and/or views an installed roof.

The trim tiles that come with our multi-color field tile are manufactured with the base color only.

Even with our stringent quality control standards, product shade variations will occur. This shading, when properly blended throughout the roof, contributes considerably to the uniqueness of every concrete tile roof. To achieve the most pleasing appearance of the completed roof, tile stacks should be made up of tile taken randomly from several pallets. Similarly, tile setters should take tile randomly from several stacks and use their best judgment as craftsmen to blend the various shades.
